CAEN will repair or replace any product within the guarantee period if the Guarantor declares that the product is defective due to workmanship or materials and has not been caused by mishandling, negligence on behalf of the User, accident or any abnormal conditions or operations.

CAEN declines all responsibility for damages or injuries caused by an improper use of the Modules due to negligence on behalf of the User. It is strongly recommended to read thoroughly the CAEN User's Manual before any kind of operation.

CAEN reserves the right to change partially or entirely the contents of this Manual at any time and without giving any notice.

Disposal of the Product

The product must never be dumped in the Municipal Waste. Please check your local regulations for disposal of electronics products.

MADE IN ITALY : We stress the fact that all the boards are made in Italy because in this globalized world, where getting the lowest possible price for products sometimes translates into poor pay and working conditions for the people who make them, at least you know that who made your board was reasonably paid and worked in a safe environment. (this obviously applies only to the boards marked "MADE IN ITALY", we can not attest to the manufacturing process of "third party" boards).

[29:0]	With "Full Suppression based on the integral", the 30 LSB value represents the value (depending on bit 30) to be compared with sum of the samples which compose the event, and see if it is over/under threshold (depending on the used logic). With "Full Suppression based on the amplitude", the 14 LSB represent the value to be compared with each sample of the event; and see if it is over/under threshold (depending on the used logic). With "Zero Length Encoding", the 14 LSB represent the value to be compared with each sample of the event, and see if it is "good" or "skip" type

2.4. Channel n ZS_NSAMP (0x1n28; r/w)

Bit	Function
[31:0]	With "Full Suppression based on the amplitude" (ZS AMP), bits [20:0] allow to set the number Ns of subsequent samples which must be found over/under threshold (depending on the used logic) necessary to validate the event; if this field is set to 0, it is considered "1". With "Zero length encoding" (ZLE) bit [31:16] allows to set/read N _{LBK} : the number of data to be stored before the signal crosses the threshold. bit [15:0] allows to set/read N _{LFWD} : the number of data to be stored after the signal crosses the threshold

2.5. Channel n Threshold (0x1n80; r/w)

Bit	Function
[13:0]	Threshold Value for Trigger Generation

Each channel can generate a local trigger as the digitised signal exceeds the V_{th} threshold, and remains under or over threshold for Nth couples of samples at least; local trigger is delayed of Nth "quartets" of samples with respect to input signal. This register allows to set V_{th} (LSB=input range/14bit).

2.6. Channel n Over/Under Threshold (0x1n84; r/w)

Bit	Function
[11:0]	Number of Data under/over Threshold

Each channel can generate a local trigger as the digitised signal exceeds the V_{th} threshold, and remains under or over threshold for Nth "quartets" of samples at least; local trigger is delayed of Nth "quartets" with respect to input signal. This register allows to set Number of samples under or over threshold (Nth*4).

1001	512	512	2K	1K
1010	1024	256	1K	512

A write access to this register causes a Software Clear. This register must not be written while acquisition is running. The number of Memory Locations depends on Custom size register setting (see § 2.17)

Local trigger coincidence level must be smaller than the number of channels enabled via bit[7:0] mask.
